#### 1. INTRODUCTION

The structural analysis for "Deck structure", fitted on "12M Crew Boat - Fiberglass" using Ansys Workbench 19.2, which the calculation is useful to determine the ability of main deck structure to accommodate loading with specification 200 Kg/m<sup>2</sup>.

As for the main deck structure's software modeling is refer to drawing are :

- a. General Arrangement
- b. Midship Section
- c. Construction Profile
- d. Construction Plan

All drawing details see at Appendix 1

#### Ship Particular are:

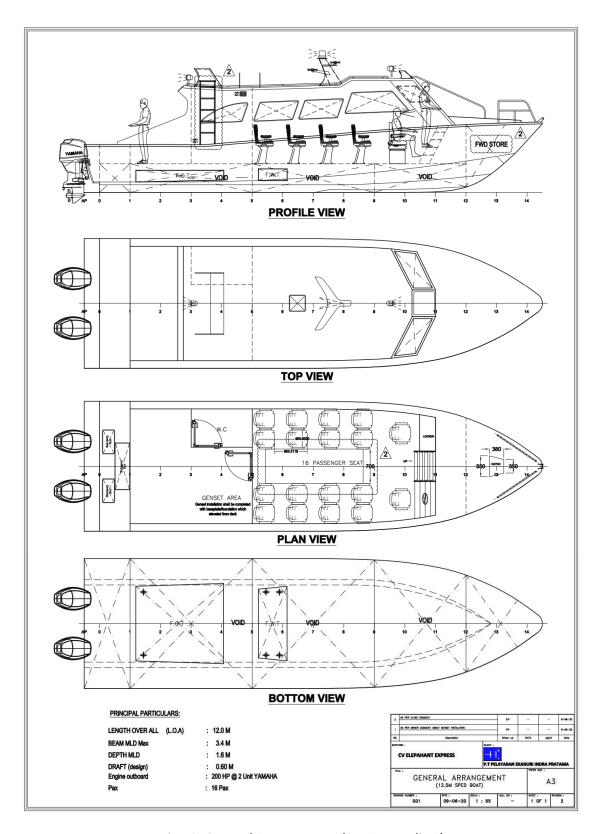

Ship Type : Fiberglass Crew Boat

Length Over All : 12.00 m

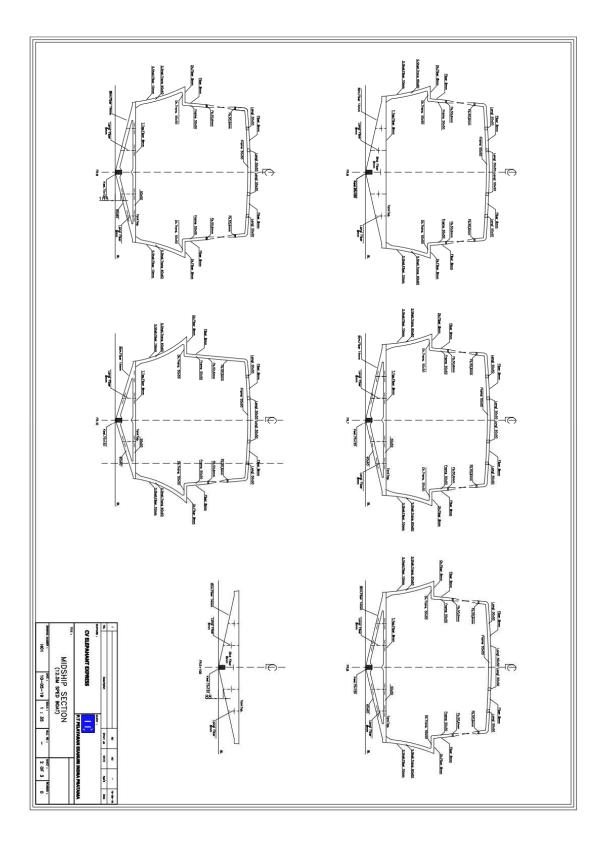

Breadth Moulded : 3.40 m

Depth Moulded (Main Deck): 1.60 m

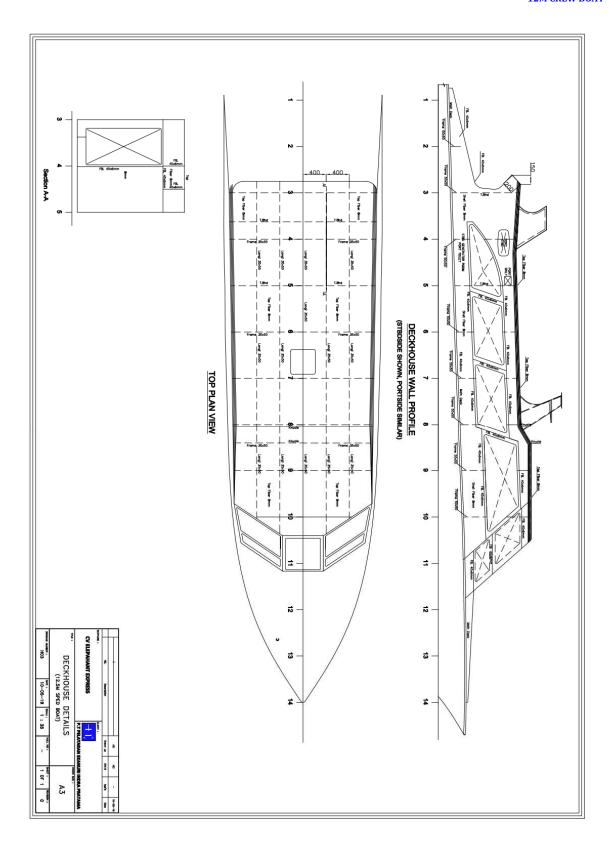

Draft Moulded : 0.50 m

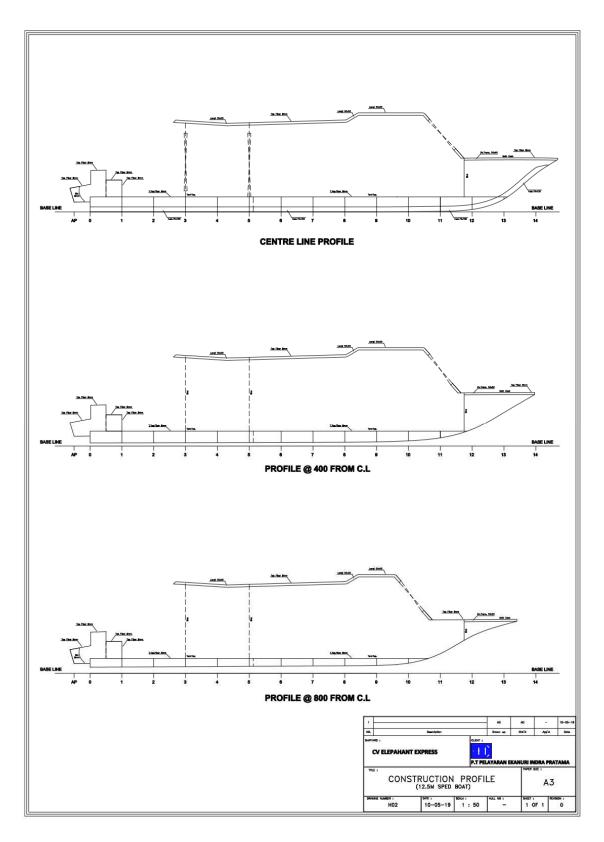

Drawing 1: General Arrangement (See Appendix 1)

Drawing 2: Midship Section

Drawing 3: Construction Plan

Drawing 4 : Construction Profile

#### 2. MODEL ANALYSIS

#### 2.1 Structural Idealization

The considerations of deck structural detail are as follows:

 For minimum yield stress material follow BKI Rule Volume V – Rules For Fiberglass Reinforced Plastic Ships 2016 Edition, Section 1 chapter C Part 4.4.1.

#### 4. Scantlings

4.1 The scantling required in these Rules are specified for FRP ships moulded with fibre glass reinforcements composed of chopped mats and roving cloths and moulded with FRP having the strength specified in the following 1 to 4, but excluding gelcoats:

| 1. | Tensile strength              | : 98                     | N/mm <sup>2</sup> |
|----|-------------------------------|--------------------------|-------------------|
| 2. | Modulus of tensile elasticity | : 6,86 x 10 <sup>3</sup> | N/mm <sup>2</sup> |
| 3. | Bending strength              | : 150                    | N/mm <sup>2</sup> |
| 4. | Modulus of bending elasticity | : 6,86 x 10 <sup>3</sup> | N/mm <sup>2</sup> |

 Structure using material Fiberglass Reinforcemnt (FRP) with Tensile Strength 98 N/mm<sup>2</sup>).

Bottom Thickness = 14 mm
 Side Shell Thickness = 10 mm
 Deck Thickness = 8 mm
 Web Keel = Square bar 120x75
 Longitudinal Web = 8 mm
 Web Girder = U profil 60x60x6mm

- For calculation using minimum Yield strength value 85 N/mm<sup>2</sup>.
- The specific gravity is 9.81 m/s² for modeling of this load capacity, which is applied for truck loading.
- Modeling applies only for plate, stiffeners and web structure without welding, using Finite Element Method and mild steel properties.

# 2.2 System Coordinate

For modeling use, the system ordinates are:

X axis = Length (positive toward bow of structure)

Y axis = Vertical (positive toward portside of structure)

Z axis = Breadth (positive upwards of structure)

For unit use, the metric systems are:

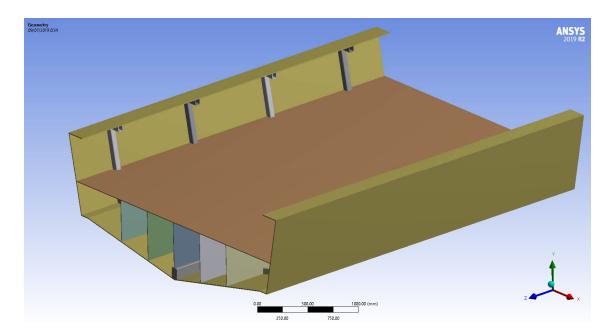

Length = mm

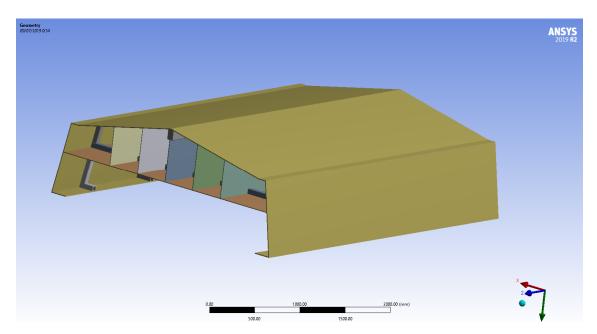

Mass = Ton

Force = Newton

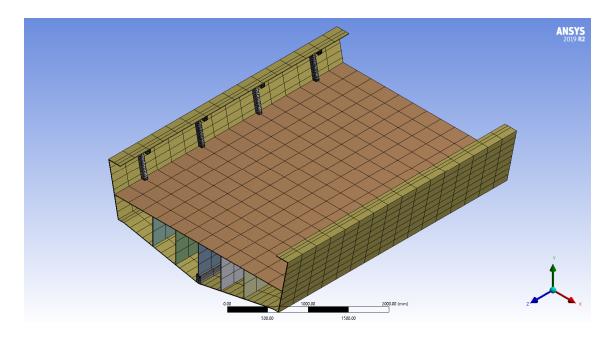

# 2.3 Modeling

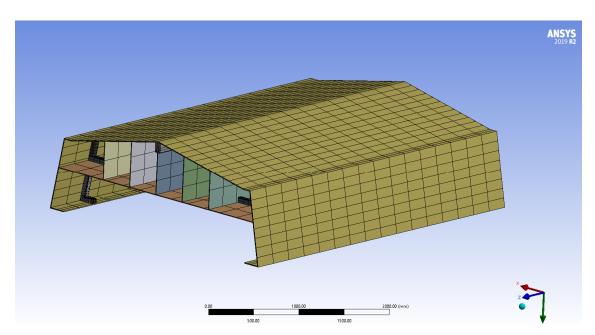

For Modeling using software Ansys Workbench with solid modeling.

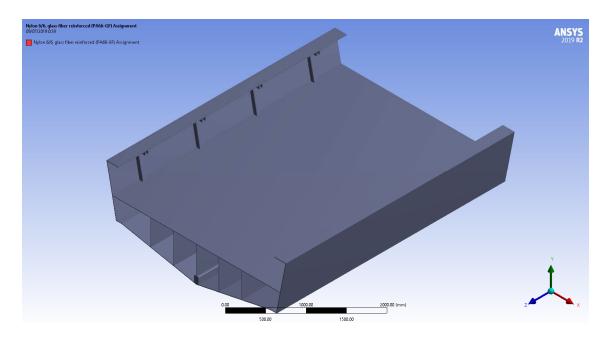

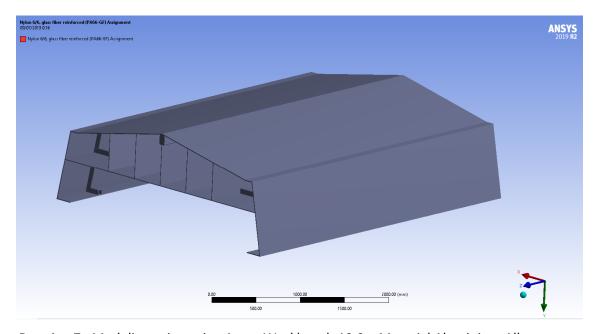

Drawing 5: Modeling using Ansys Workbench 19.2 - Geometry

Drawing 6: Modeling using Ansys Workbench 19.2 – Meshing

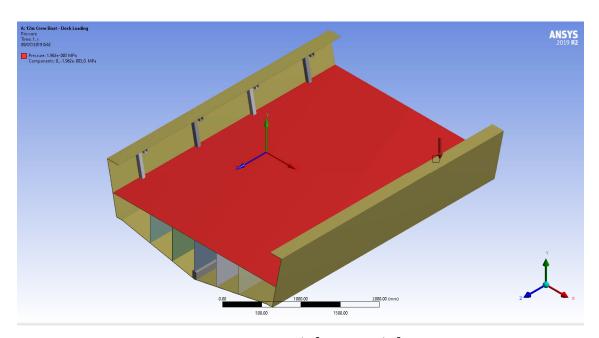

Drawing 7: Modeling using using Ansys Workbench 19.2 – Material Aluminium Alloy

#### 2.4 Loading Condition

Follow requirement from owner deck load of the vessel are 200 Kg/m2, with specification gravity are  $9.81 \text{ m/s}^2$ .

Total load pressure are

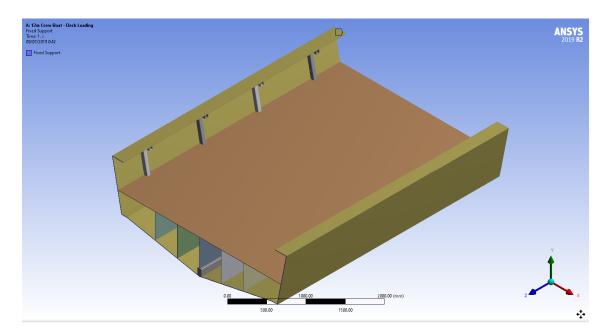

- = 200 x 9.81
- = 1962 N/m<sup>2</sup> -----> 0.001962 Mpa

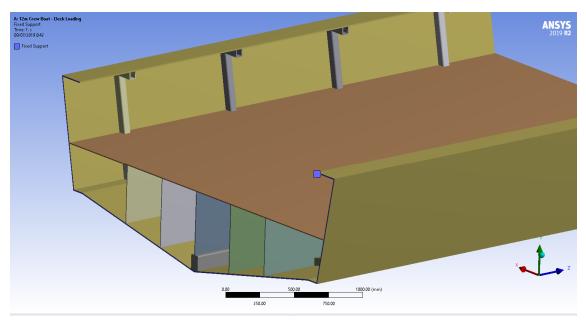

Drawing 8 : Loading with deck load 200 Kg/m $^2$  = 1962 N/m $^2$  = 1.962e-003 MPa

# 2.5 Boundary Condition

It's using a fixed boundary at bottom plate structure (see at Appendix for Boundary Condition Drawing).

Drawing 9: Boundary condition with fixed type boundary

#### 3 ACCEPTABLE CRITERIA

Von Misses stress which obtained from Finite Element Method Analysis is directly used for assessing the adequacy of structures against failure of yielding.

For Plated Structures; member might designed according to Von Misses equivalent stress criteria, where the equivalent stress  $\delta_{eqv}$  is not exceeding  $F_y$  / F.S.

As for Safety Factor (F.S.) = 1.0 for Static Loading, therefore:

 $\delta_e \le Fy /1.00$ 

 $\delta_e \le 98/1.00$  ----> where  $F_v$  for Fiberglass using = 98 N/mm<sup>2</sup>

 $\delta_e \le 98.0 \text{ N/mm}^2$ 

Note :  $\delta_e$  = Von Misses Stress

F<sub>y</sub> = Material Yield Stress

Stress contour legend is uniformly customized with levels contour, so that high stress area (if any) can be easily identified.

#### **4 ANALYSIS RESULT**

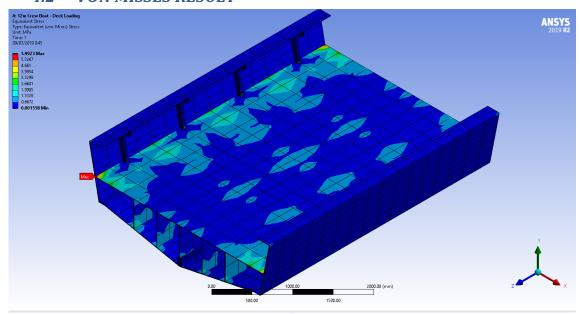

The analysis results for barge structures are describe in Appendix and summarize in table below.

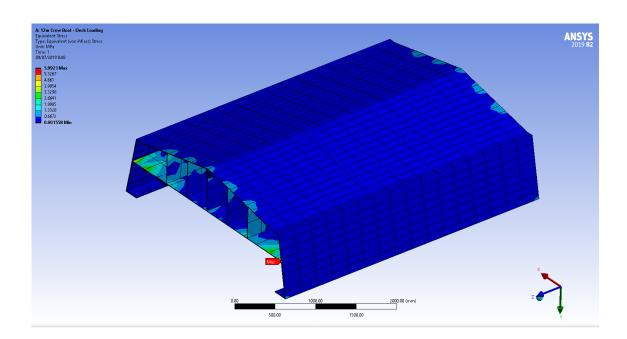

#### 4.1 RESUME

Table 1: Summary of Plate Von Misses

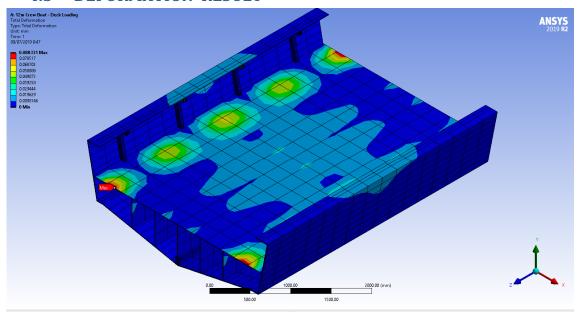

| Area      | Load Applied<br>(in Kg/m2) | Stress<br>(N/mm2) | Acceptable<br>Criteria | Result | Safety<br>Factor |  |
|-----------|----------------------------|-------------------|------------------------|--------|------------------|--|
| Deck Load | 200                        | 5.992             | 98.00                  | Pass   | 16.35            |  |
|           |                            |                   |                        |        |                  |  |
|           |                            |                   |                        |        |                  |  |

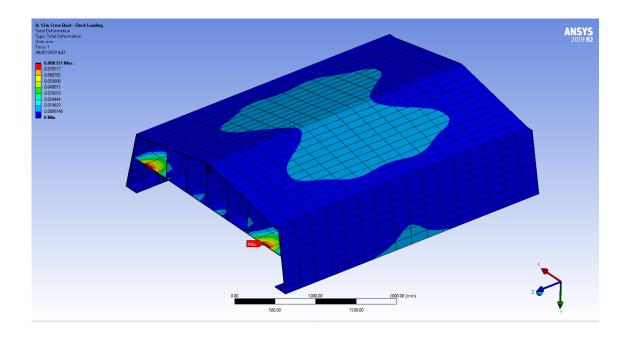

#### 4.2 VON MISSES RESULT

# 4.3 DEFORMATION RESULT

# **5 CONCLUSION**

According to the analysis result, it can be concluded that strength of Main Deck structure at 12M Fiberglass Crew Boat **adequate** for the intended loading with deck load 200 Kg/ $m^2$ , with safety load factor are 16.35.

# **APPENDIX 1 - DRAWING**
